

Sensitivity of the pooled metal comparisons

96-h Cu-Cd-Zn LMM

Primary LC50 ratios, omission checks, alternative model specifications and environmental sensitivity

LORO = one publication omitted at a time; LOSO = one species group omitted at a time. Grey bands show the resulting point-estimate ranges.
RI = random intercept; FE = fixed effect. Cell collapse = one mean ln(LC50) per publication x species x metal group.
CC = records with both temperature and salinity reported. CC + T + S = the same subset with temperature and salinity added to the model.
Open circles and bars: model ratios and Tukey-adjusted 95% confidence intervals. Grey bands show point-estimate ranges, not confidence intervals.
